QVFT

VERTICAL FARMING TEAM

SPONSORSHIP PACKAGE

"GROWING THE FOOD OF THE FUTURE AT QUEEN'S UNIVERSITY"

TABLE OF CONTENTS

ABOUT US

INTRODUCTION

Founded in Sep. 2019, QVFT is Canada's first student-led university vertical farming design team. Vertical farming is a hyper-efficient, sustainable food cultivation method which is projected to become a major contributor to global food production in the coming decades.

Our goal is to develop a functional vertical farm at Queen's University. We request your generous support for the Winter 2020 semester, every ounce of which goes directly towards reaching our next major milestone: building a functional prototype farm by April 2020.

OUR MISSION

"The Queen's Vertical Farming Team's mission is to develop a functional, small scale vertical farm. Drawing inspiration from the best current commercial practices, our goal is to gain a foothold as an innovator in a rapidly expanding industry"

QVFT

TIMELINE

November 2019

Hire 2019-20 Executive Members

December 2019

Begin Sponsorship Outreach

Research and Design Phase I

- Complete technical overview of Controlled-Environment Agriculture (CEA) system
- Complete technical overview of mechanical system

Set Goals and Develop Implementation Strategies

January 2020

Hire 2020 General Members

Participate in Commerce & Engineering Environmental Conference Trade Show

Research and Design Phase II

- Initiate CEA hardware and software development
- Research plant germination strategies, nutritional requirements, lighting cycles, and water consumption
- Develop a step-by-step plant cultivation protocol

February 2020

Research and Design Phase III

- CEA system is in beta
- Finalize all CAD drawings for custom parts
- Finalize plant cultivation protocol and complete research report

Prototyping and Experimentation Phase I

- Manufacture custom parts
- Order non-custom parts

March 2020

Hire 2020-21 Executive Members

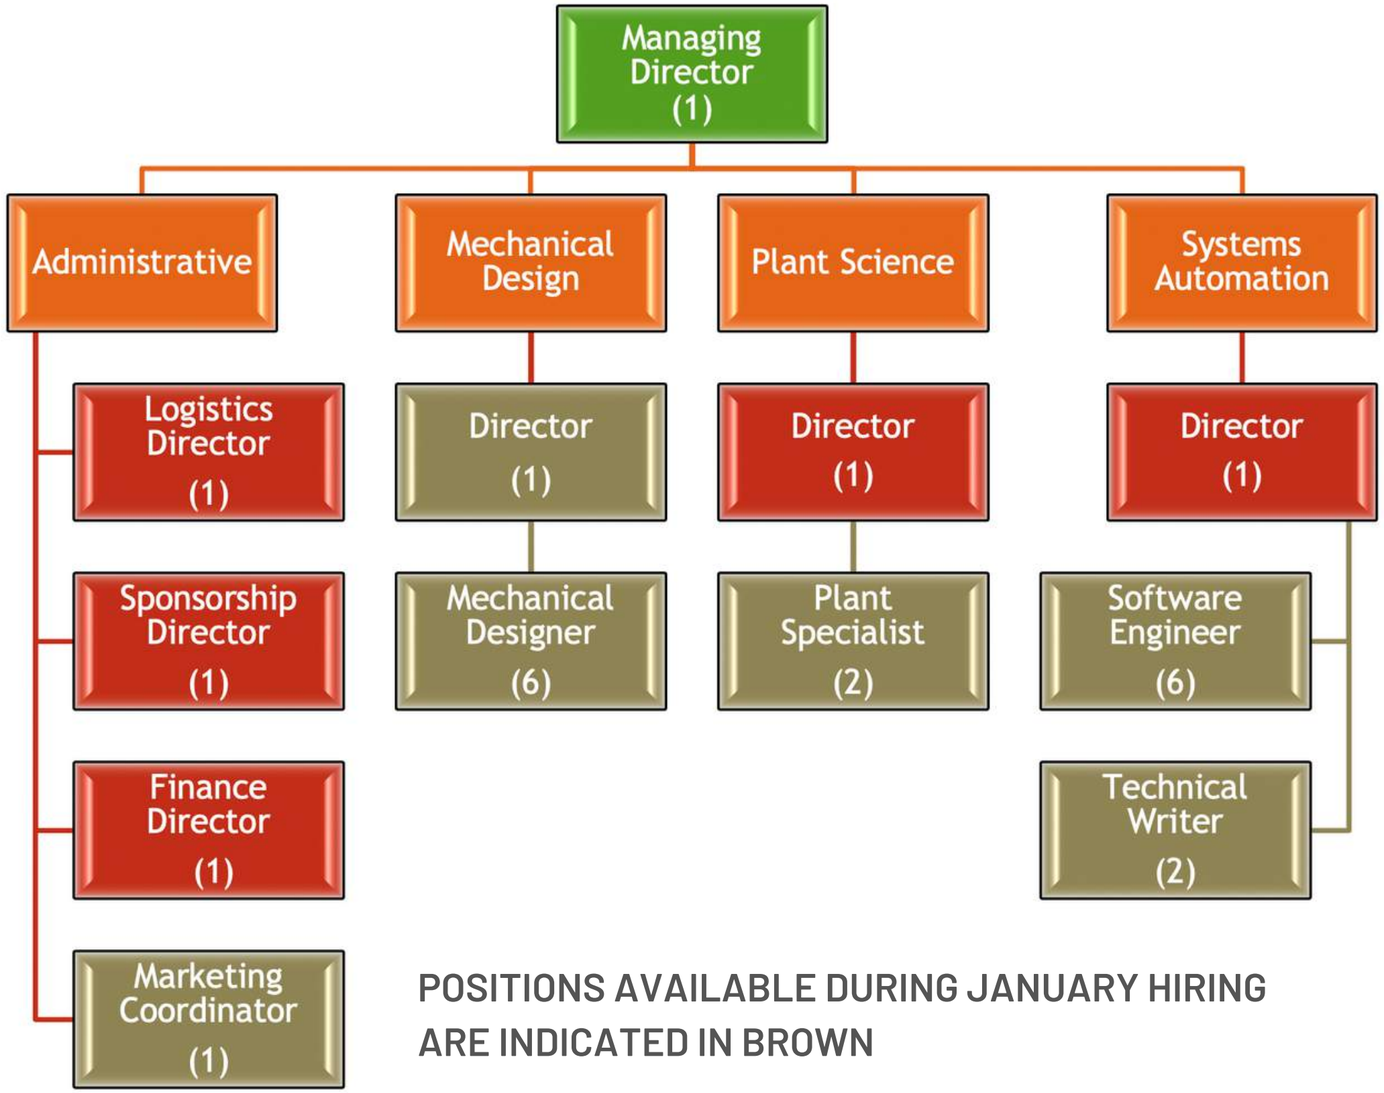
Prototyping and Experimentation Phase II

- Begin plant germination process

April 2020

Wrap Up Efforts and Prepare to Resume in September 2020

ORGANIZATIONAL STRUCTURE



POSITIONS AVAILABLE DURING JANUARY HIRING ARE INDICATED IN BROWN

CURRENT MEMBERS

PATRICK SINGAL

Managing Director | Mechanical Eng.

ROSS HILL

Systems Automation Direct. | Computing

LIAM STRACHAN

Sponsorship Director | Economics

MICHAEL MILLS

Logistics Director | Engineering Physics

LUKE EMBLEM

Finance Director | Economics

ZWETLANA RAJESH

Plant Science Director | Health Studies

DAVID ALTROWS

Software Engineer | Mechanical Eng.

ABDUL ELAH RIZAN

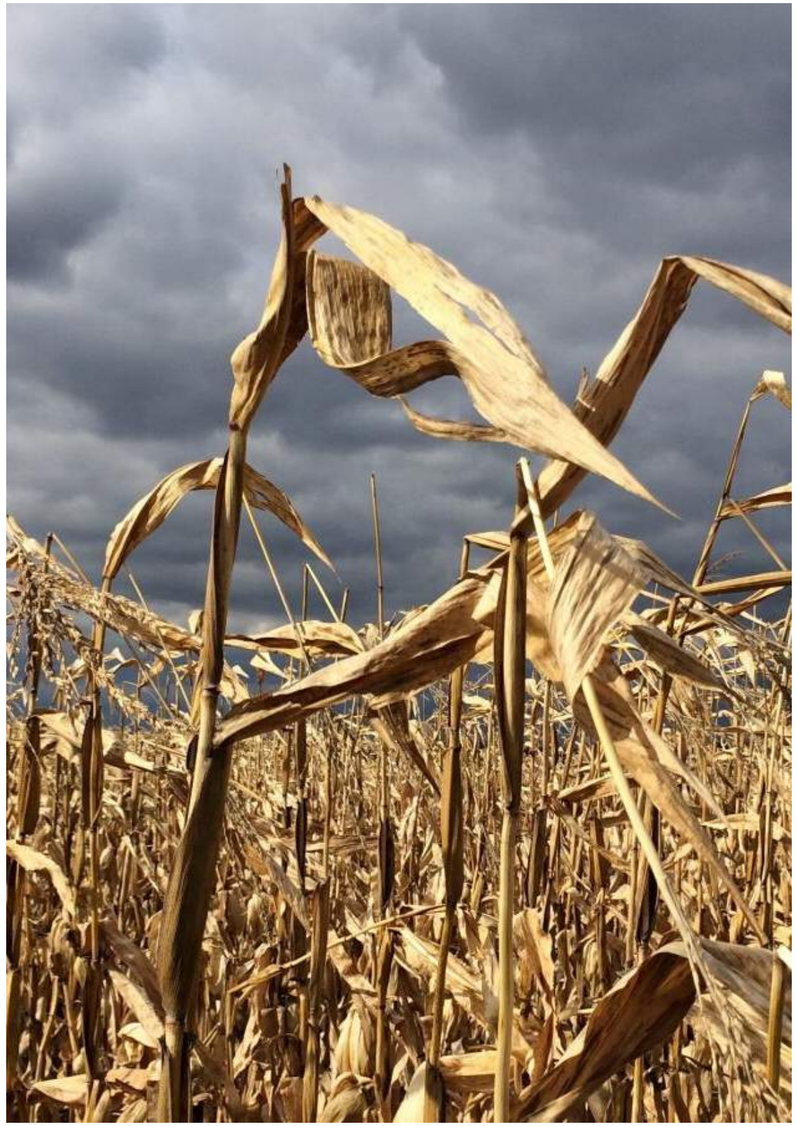
Software Engineer | Mechanical Eng.

WHY VERTICAL FARMING?

THE PROBLEM

A global trend of increasing concern is the diminishing supply of arable land per capita. Given climate change, urbanization, and soil degradation, the United Nations Food and Agriculture Organization (FAO) projects that by 2050, arable land per capita will fall to one third of the amount available in 1970. A 2018 report by the Intergovernmental Panel on Climate Change (IPCC) raised further alarm, predicting that humanity will reach an environmental "point of no return" within the next two decades.

Given the existential threat of climate change, and the enormous toll taken by unsustainable agriculture on the environment, global food security in the coming decades will largely depend on our ability to adapt and overhaul existing cultivation practices.



THE SOLUTION

Vertical farming is a cultivation practice in which crops grow in an indoor, urban, climate-controlled facility. This approach is associated with dramatically reduced water consumption, slashed transportation costs, organic produce, massive improvements in per-acre land productivity, increased plant productivity, and the freedom to cultivate crops in any location, year-round. These benefits are made possible through controlled-environment agriculture (CEA) , which allows for the artificial optimization of environmental inputs such as lighting, temperature, moisture, and nutritional availability.

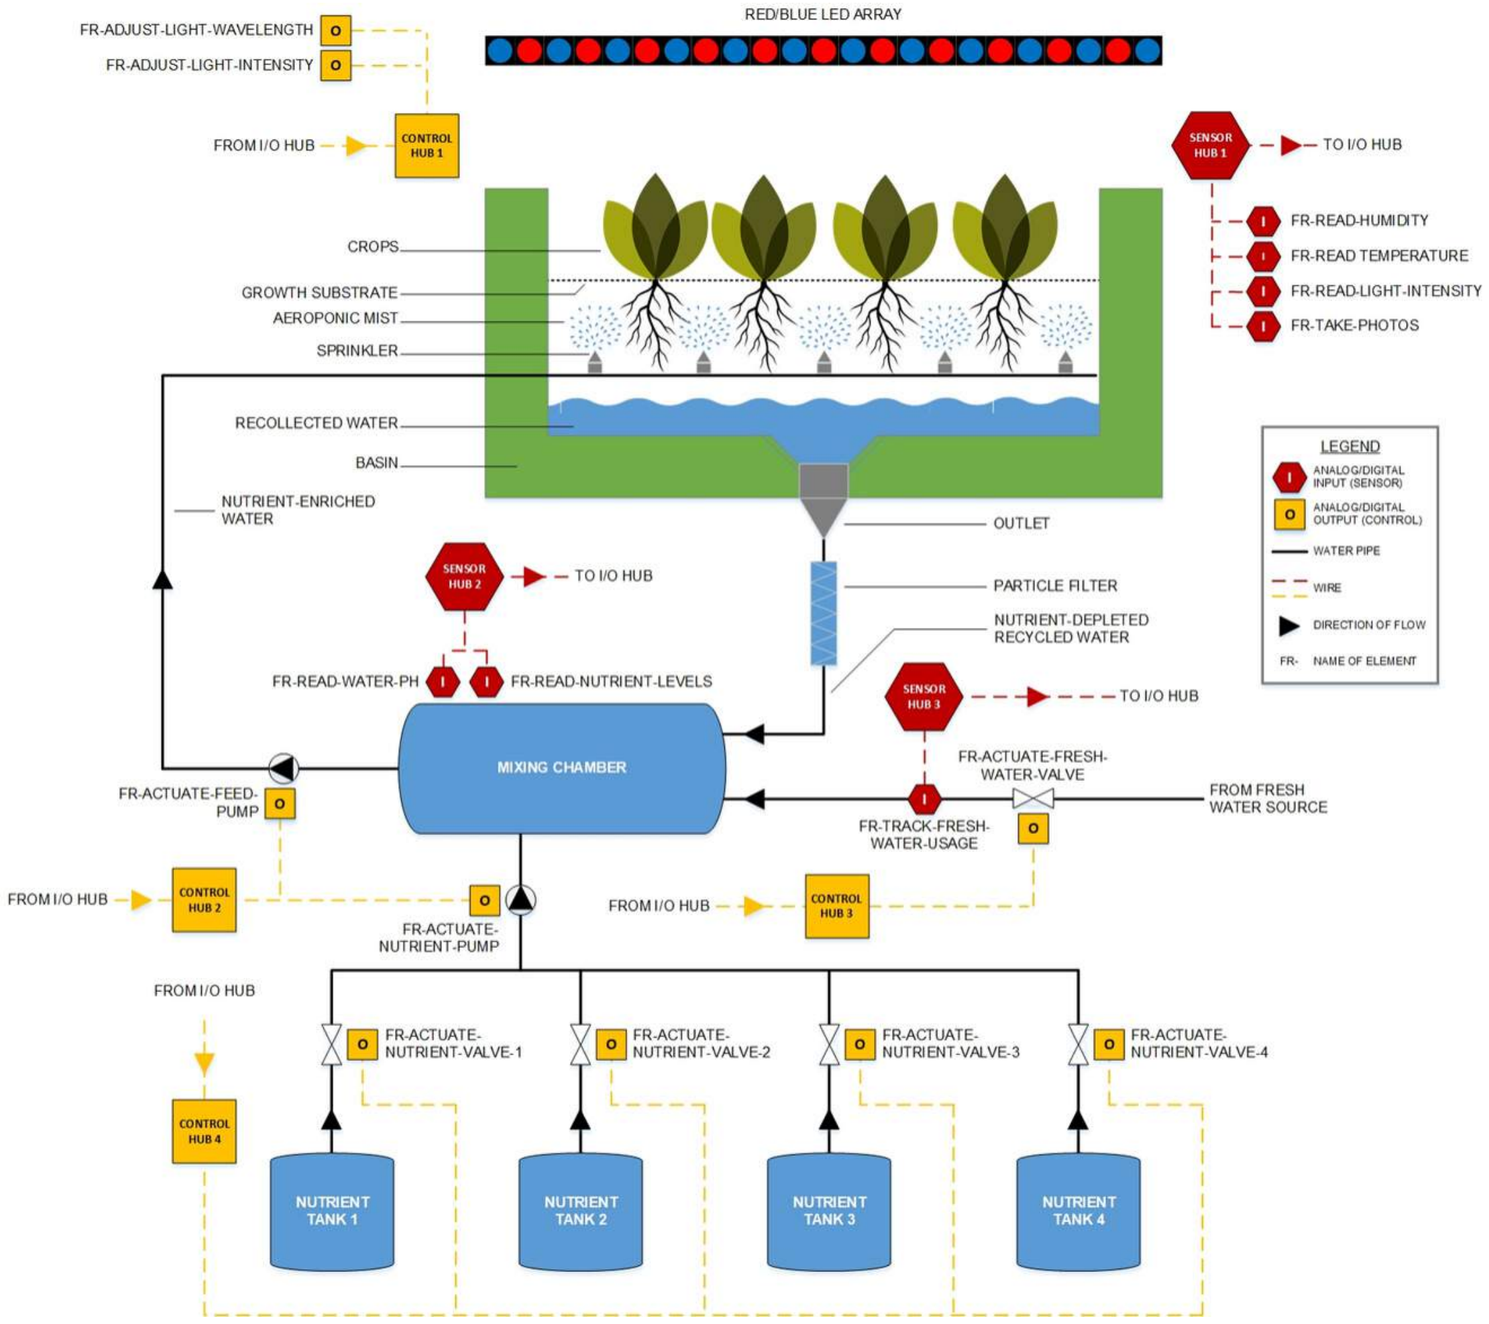
WHAT WE DO

CROP SELECTION METHODOLOGY

As vertical farming is a cost-intensive cultivation method, current industry practices focus on small, premium crops that have short growth cycles and high automation potential. Examples include leafy greens such as baby lettuce, spinach, and kale, which have a brief growth cycle of roughly 50–65 days. QVFT will focus exclusively on the cultivation of leafy greens, as the commercial farming systems from which we draw inspiration are designed specifically for such purposes. Starting in February 2020, we will cultivate a small batch of baby lettuce as a litmus test for our prototype. This will provide feedback regarding the efficacy of our system and identify areas of improvement for when we scale our model in the following school year.

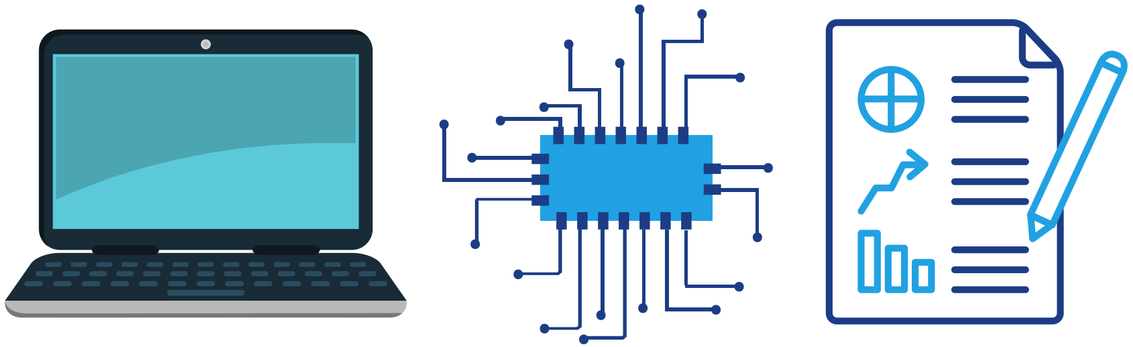
AEROPONIC SYSTEM

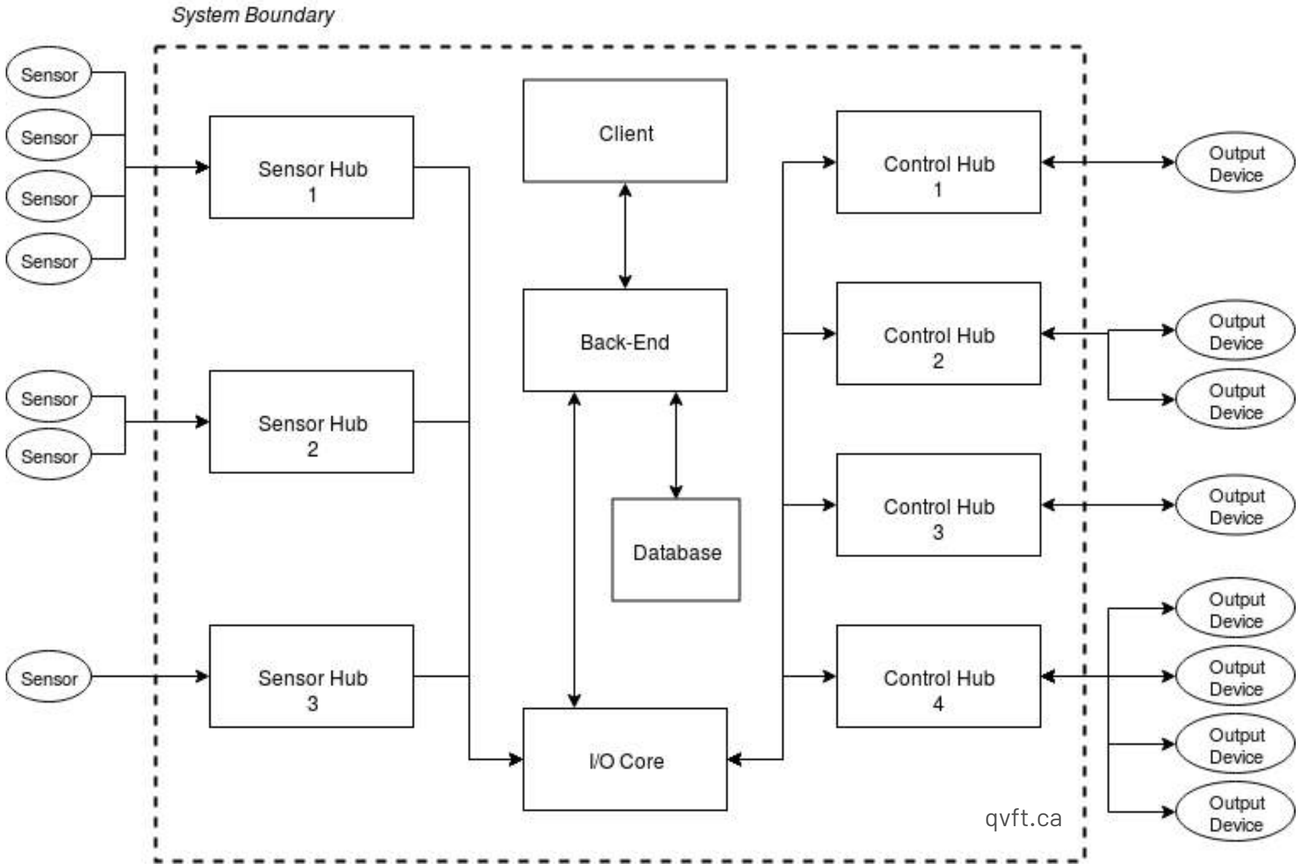
QVFT employs an aeroponic cultivation method, in which nutrients are dissolved in water (fertigation) and misted directly onto roots via spray nozzles. Crops rest on a thin, porous substrate, through which their roots dangle in a basin below. Requiring no soil, this approach allows the grower near-complete control over the specific nutrient mix a plant receives. Shown at right is an early-stage schematic of our proposed design.



CONTROLLED-ENVIRONMENT AGRICULTURE (CEA) SYSTEM

CEA is a method of optimizing plant growth conditions by means of an integrated, software-controlled sensory network. Our proposed system (see right) aims to control, monitor, and maximize farming yield by comparing realtime environmental data to pre-set environmental targets, and adjusting the internal growing environment accordingly. The CEA system will serve as the central control hub for the lighting, irrigation, fertigation, ventilation, and climate control systems.





PROMOTIONAL OPPORTUNITIES

SHORT TERM

Between January and April 2020, QVFT will host several educational tasters and deliver presentations at sustainability-related school events. We are currently scheduled to participate in the Commerce & Engineering Environmental Conference (CEEC) trade show, which runs from Jan. 30th to Feb. 1st. Our first taster will also be held in January, and will consist of a mixed seminar and Q&A format. These events allow us to promote our sponsors, increase general awareness of vertical farming, and introduce ourselves to like-minded students who may be interested in joining us.

ceec.ca

LONG TERM

QVFT's long term goal (3-4 years) is to create a national vertical farming design competition, available to student teams on university campuses across Canada. This competition will encourage other schools to develop vertical farming teams of their own and will provide a venue for students to compete and compare results in a range of categories. The results will be judged by industry professionals, with opportunities to share best practices and network within the industry. This goal will be pursued only after QVFT has reached sufficient maturity.
